

On the Grothendieck-Lefschetz Theorem for a Family of Varieties

Marco Antei, Vikram B. Mehta

November 13, 2011

Abstract. Let k be an algebraically closed field of characteristic $p > 0$, W the ring of Witt vectors over k and R the integral closure of W in the algebraic closure \overline{K} of $K := \text{Frac}(W)$; let moreover X be a smooth, connected and projective scheme over W and H a relatively very ample line bundle over X . We prove that when $\dim(X/W) \geq 2$ there exists an integer d_0 , depending only on X , such that for any $d \geq d_0$, any $Y \in |H^{\otimes d}|$ connected and smooth over W and any $y \in Y(W)$ the natural R -morphism of fundamental group schemes $\pi_1(Y_R, y_R) \rightarrow \pi_1(X_R, y_R)$ is faithfully flat, X_R, Y_R, y_R being respectively the pull back of X, Y, y over $\text{Spec}(R)$. If moreover $\dim(X/W) \geq 3$ then there exists an integer d_1 , depending only on X , such that for any $d \geq d_1$, any $Y \in |H^{\otimes d}|$ connected and smooth over W and any section $y \in Y(W)$ the morphism $\pi_1(Y_R, y_R) \rightarrow \pi_1(X_R, y_R)$ is an isomorphism.

1 Introduction

The notion of fundamental group scheme of a connected and reduced scheme over a perfect field has been introduced by Madhav Nori in [13] and [14] as the affine group scheme over k naturally associated to the tannakian category of essentially finite vector bundles. Then in [3] it has been generalized by Gasbarri

for integral schemes over a connected Dedekind scheme. In this latter description, however, the tannakian tool used by Nori is absent. This has been added by the second (alphabetically) author and Subramanian in [12] where they describe the fundamental group scheme of a smooth and projective scheme over a certain Prüfer ring R (more details will be recalled in section 3) by means of tannakian lattices introduced by Wedhorn in [15].

Now let Z be a smooth and projective variety over an algebraically closed field k . If Y is any smooth ample hypersurface on Z and y any point of Y then by Grothendieck-Lefschetz theory (cf. [4], Exposé X) we know that the induced group homomorphism between the étale fundamental groups

$$\pi_1^{\text{ét}}(Y, y) \rightarrow \pi_1^{\text{ét}}(Z, y)$$

is surjective when $\dim(Z) \geq 2$ and an isomorphism when $\dim(Z) \geq 3$, thus in particular if $\text{char}(k) = 0$ the same result automatically holds for the fundamental group scheme (even when k is not algebraically closed and this can be seen using the fundamental short exact sequence). When $\text{char}(k) = p > 0$ then in [10] and [1] it has been proved, independently, that theorems of Grothendieck-Lefschetz type hold in the following formulation: let H be a very ample line bundle over Z then when $\dim(Z) \geq 2$ the natural homomorphism $\hat{\varphi} : \pi_1(Y, y) \rightarrow \pi_1(Z, y)$ between fundamental group schemes induced by the inclusion map $\varphi : Y \hookrightarrow Z$ is faithfully flat whenever Y is in the complete linear system $|H^{\otimes d}|$ for any integer $d \geq d_0$ where d_0 is an integer depending only on Z . If moreover $\dim(Z) \geq 3$, then $\hat{\varphi}$ is an isomorphism whenever Y is in the complete linear system $|H^{\otimes d}|$ for any integer $d \geq d_1$ where d_1 is an integer depending only on Z .

Let finally k be an algebraically closed field of characteristic $p > 0$, W the ring of Witt vectors over k and R the integral closure of W in the algebraic closure \bar{K} of $K := \text{Frac}(W)$, in this paper we prove the following generalization (where the subscript R will denote the pull back over $\text{Spec}(R)$):

Theorem 1.1. *(Cf. Theorems 3.2 and 3.3) Let X be a smooth and projective scheme over W and H a relatively very ample line bundle over X .*

1. *If $\dim(X/W) \geq 2$ then there exists an integer d_0 (depending only on X) such that for any $d \geq d_0$, any $Y \in |H^{\otimes d}|$ connected and smooth over W and any $y \in Y(W)$ the natural R -morphism of fundamental group schemes $\pi_1(Y_R, y_R) \rightarrow \pi_1(X_R, y_R)$ is faithfully flat.*
2. *If moreover $\dim(X/W) \geq 3$ then there exists an integer d_1 (depending only on X) such that for any $d \geq d_1$, any $Y \in |H^{\otimes d}|$ connected and smooth over W and any $y \in Y(W)$ the morphism $\pi_1(Y_R, y_R) \rightarrow \pi_1(X_R, y_R)$ is an isomorphism.*

Acknowledgments: M. Antei would like to thank Vikram Mehta for the invitation to the Tata Institute of Fundamental Research of Mumbai where this

paper has been conceived. V. B. Mehta would like to thank the ICTP, Trieste for hospitality.

2 Vanishing lemmas

Notation 2.1. Throughout this section k will be an algebraically closed field of positive characteristic p and X a smooth and projective scheme over k .

In section 3 we will strongly make use of the vanishing Lemmas 2.3 and 2.8 whose idea is already contained in [10], lemmas 2.2 and 3.3. Let H be a very ample line bundle on X . Moreover let $F_X : X \rightarrow X$ be the absolute Frobenius morphism, then we denote by F_X^m the m -th iterate of F_X . We recall that a vector bundle V over X is essentially finite (cf. [13] and [14] for Nori's definition) if there exists a finite k -group scheme G and a principal G -bundle $\pi : E \rightarrow X$ such that $\pi^*(V)$ is trivial on E . We also recall (cf. [11]) that a vector bundle V over X is called F -trivial if there exists an integer $n \geq 0$ such that $F_X^{n*}(V)$ is trivial on X . When V is essentially finite then there exists an integer $n \geq 0$ such that $F_X^{n*}(V)$ is Galois étale trivial (cf. [11]), i.e. there exists a Galois étale covering $\pi' : E' \rightarrow X$ such that $\pi'^*(F_X^{n*}(V))$ is trivial on E' (the converse is also true). We denote by $EF(X)$ the tannakian category of essentially finite vector bundles over X . We finally recall that $V \in EF(X)$ if and only if the dual $V^* \in EF(X)$. We will often use the notation $V^{(p^m)} = F_X^{m*}(V)$ for every integer $m \geq 0$ for the comfort of the reader.

Remark 2.2. Let Ω_X^\bullet be the De Rham complex and let us set $B_X^j := \text{Im}(d : \Omega_X^{j-1} \rightarrow \Omega_X^j)$ and $Z_X^j := \text{Ker}(d : \Omega_X^j \rightarrow \Omega_X^{j+1})$ for all $j > 0$, then we can define the Cartier operator

$$C_X : Z_X^\bullet \rightarrow \Omega_X^\bullet$$

whose kernel is B_X^\bullet ; in particular we have the following exact sequences of vector bundles

$$0 \rightarrow B_X^1 \rightarrow Z_X^1 \rightarrow \Omega_X^1 \rightarrow 0, \quad (1)$$

$$0 \rightarrow \mathcal{O}_X \rightarrow F_{X*}(\mathcal{O}_X) \rightarrow B_X^1 \rightarrow 0, \quad (2)$$

$$0 \rightarrow Z_X^1 \rightarrow F_{X*}(\Omega_X^1) \rightarrow B_X^2 \rightarrow 0. \quad (3)$$

Lemma 2.3. *Assume $\dim(X) \geq 2$. Let V be any essentially finite vector bundle over X , then there exists a uniform (i.e. depending only on X) positive integer n_0 such that $H^1(X, V(-n))$ vanishes for all $n > n_0$.*

Proof. (See also [1], Lemma 4.7.) Let us consider the exact sequence (2):

$$0 \rightarrow \mathcal{O}_X \rightarrow F_{X*}(\mathcal{O}_X) \rightarrow B_X^1 \rightarrow 0$$

and tensor it by $V(-n)$; then we have the induced long exact sequence

$$\dots \rightarrow H^0(X, V(-n) \otimes B_X^1) \rightarrow H^1(X, V(-n)) \rightarrow H^1(X, F_{X*}(\mathcal{O}_X) \otimes V(-n)) \rightarrow \dots$$

By the projection formula we have $F_{X*}(\mathcal{O}_X) \otimes V(-n) \simeq F_{X*}(F_X^*(V(-n)))$ thus $H^1(X, F_{X*}(\mathcal{O}_X) \otimes V(-n)) \simeq H^1(X, F_X^*(V(-n))) = H^1(X, V^p(-np))$. Moreover

$$H^0(X, V(-n) \otimes B_X^1) \simeq \mathcal{H}om(V^*(n), B_X^1)(X) \simeq \mathcal{H}om(V^*(n), B_X^1)$$

and $\mathcal{H}om(V^*(n), B_X^1) = 0$ as soon as $\mu(V^*(n)) > \mu_{max}(B_X^1)$. Set $n_0 := \mu_{max}(B_X^1)$, so that previous inequality becomes $n > n_0$. Thus, when $n > n_0$, the morphism

$$H^1(X, V(-n)) \rightarrow H^1(X, V^p(-np))$$

becomes injective. Iterating the process (tensor (2) by $V^p(-np)$ and so on) we obtain the injective morphism

$$H^1(X, V(-n)) \rightarrow H^1(X, V^{(p^m)}(-np^m)) \quad (4)$$

for every $m \geq 0$ and every $n > n_0$ where, we recall, $n_0 = \mu_{max}(B_X^1)$ depends only on X . We have already recalled that since $V \in EF(X)$ then there exists an integer $l \geq 0$ such that $F_X^{l*}(V)$ is Galois étale trivial, then so are its stable components $V_i, i = 1, \dots, L$, where L is the length of its Jordan-Hölder filtrations. Thus every V_i is stable and Galois étale trivial then by [2], Théorème 2.3.2.4 for every i there exists an integer $t_i > 0$ such that $F_X^{t_i*}(V_i) \simeq V_i$. This implies that the isomorphism classes of stable components of the vector bundles in the family $\{F_X^{t*}(V)\}_{t>0}$ are only finitely many. Denote these isomorphism classes of stable vector bundles by $\{W_j\}_{j \in J}$, then by the Enriques-Severi-Zariski-Serre vanishing lemma and the fact that $|J| < +\infty$ we know that $H^1(X, W_j(-np^s)) = 0$ for all $s \gg 0$ then $H^1(X, V^{(p^m)}(-np^m)) = 0$ for all $m \gg 0$. Now remember that for $n > n_0$ we have the injection (4) hence $H^1(X, V(-n)) = 0$. \square

Remark 2.4. Using arguments similar to those that in Lemma 2.3 allowed us to prove that $H^1(X, V^{(p^m)}(-np^m))$ vanishes for all $m \gg 0$ one also proves that $H^2(X, V^{(p^t)}(-np^t))$ vanishes for all $t \gg 0$.

The aim of the remainder of this section is to prove a vanishing result for the group $H^2(X, V(-n))$. This will be done in Lemma 2.8, but we first need some preliminary steps. Let us start with a lemma which is also proved in [1], Proposition 4.11:

Lemma 2.5. *Assume $\dim(X) \geq 2$. Let V be any essentially finite vector bundle over X , then there exists a uniform positive integer n_1 such that $H^1(X, \Omega_X^1 \otimes V(-n))$ vanishes for all $n > n_1$.*

Proof. Let \mathcal{T}_X be the tangent bundle of X , then $\mathcal{T}_X(s)$ is generated by a finite number of global sections for some integer s depending only on X , then we have an exact sequence

$$0 \rightarrow S^* \rightarrow \mathcal{O}_X^N \rightarrow \mathcal{T}_X(s) \rightarrow 0 \quad (5)$$

for some vector bundle S ; dualizing we obtain

$$0 \rightarrow \Omega_X^1(-s) \rightarrow \mathcal{O}_X^N \rightarrow S \rightarrow 0 \quad (6)$$

then we tensor by $V(-m)$ for some positive integer m and we get the following exact sequence

$$0 \rightarrow \Omega_X^1(-s) \otimes V(-m) \rightarrow \mathcal{O}_X^N \otimes V(-m) \rightarrow S \otimes V(-m) \rightarrow 0; \quad (7)$$

consider the induced long exact sequence

$$H^0(X, S \otimes V(-m)) \rightarrow H^1(X, \Omega_X^1 \otimes V(-m-s)) \rightarrow H^1(X, V(-m))^N \quad (8)$$

Now $H^0(X, S \otimes V(-m)) = 0$ as soon as $m > \mu_{\max}(S)$ and $s_0 := \mu_{\max}(S)$ is clearly independent from V . Moreover by Lemma 2.3 there exists n_0 dependent only on X such that $H^1(X, V(-m))^N = 0$ for all $m > n_0$. Thus $H^1(X, \Omega_X^1 \otimes V(-m-s)) = 0$ for $m > \max\{n_0, s_0\}$. We have thus proved that there exists an integer n_1 such that $H^1(X, \Omega_X^1 \otimes V(-n)) = 0$ for all $n > n_1$. \square

Remark 2.6. Assume $\dim(X) \geq 2$. Let V be any essentially finite vector bundle over X , n an integer such that $n > n_1$, as defined in Lemma 2.5 then $H^1(X, F_{X*}(\Omega_X^1) \otimes V(-n))$ vanishes. Indeed $F_{X*}(\Omega_X^1) \otimes V(-n) \simeq F_{X*}((V^p(-np)) \otimes \Omega_X^1)$ thus $H^1(X, F_{X*}(\Omega_X^1) \otimes V(-n)) \simeq H^1(X, (V^p(-np)) \otimes \Omega_X^1)$ and the latter is trivial by Lemma 2.5, V^p being essentially finite.

Lemma 2.7. Assume $\dim(X) \geq 2$. Let V be any essentially finite vector bundle over X , then there exists a uniform positive integer n_2 such that $H^1(X, V(-n) \otimes B_X^1)$ vanishes for all $n > n_2$.

Proof. We tensor (cf. Remark 2.2)

$$0 \rightarrow B_X^1 \rightarrow Z_X^1 \rightarrow \Omega_X^1 \rightarrow 0$$

by $V(-n)$ then we get the long exact sequence

$$\dots \rightarrow H^0(X, \Omega_X^1 \otimes V(-n)) \rightarrow H^1(X, B_X^1 \otimes V(-n)) \rightarrow H^1(X, Z_X^1 \otimes V(-n)) \rightarrow \dots$$

but $H^0(X, \Omega_X^1 \otimes V(-n)) = \text{Hom}(V^*(n), \Omega_X^1) = 0$ as soon as $n > \mu_{\max}(\Omega_X^1)$ where $r_1 := \mu_{\max}(\Omega_X^1)$ is independent of V . Thus

$$H^1(X, B_X^1 \otimes V(-n)) \hookrightarrow H^1(X, Z_X^1 \otimes V(-n)) \quad (9)$$

is injective for all $n > r_1$. In a similar way, tensoring

$$0 \rightarrow Z_X^1 \rightarrow F_{X*}(\Omega_X^1) \rightarrow B_X^2 \rightarrow 0$$

by $V(-n)$ we obtain the injection

$$H^1(X, Z_X^1 \otimes V(-n)) \hookrightarrow H^1(X, F_{X*}(\Omega_X^1) \otimes V(-n)) \quad (10)$$

for all $n > r_2$, with $r_2 := \mu_{\max}(B_X^2)$. Combining (9) and (10) we obtain the injection

$$H^1(X, B_X^1 \otimes V(-n)) \hookrightarrow H^1(X, F_{X*}(\Omega_X^1) \otimes V(-n))$$

for all $n > \max\{r_1, r_2\}$. But the group $H^1(X, F_{X*}(\Omega_X^1) \otimes V(-n))$ is trivial for all $n > n_1$, according to Remark 2.6. Now let us set $n_2 := \max\{r_1, r_2, n_1\}$, then for all $n > n_2$ we have $H^1(X, B_X^1 \otimes V(-n)) = 0$, as required. \square

Lemma 2.8. *Assume $\dim(X) \geq 3$. Let V be any essentially finite vector bundle over X , then there exists a uniform positive integer n_2 such that $H^2(X, V(-n))$ vanishes for all $n > n_2$.*

Proof. (See also [1], Lemma 4.12.) By Remark 2.2 we have the exact sequence

$$0 \rightarrow \mathcal{O}_X \rightarrow F_{X*}(\mathcal{O}_X) \rightarrow B_X^1 \rightarrow 0$$

that we tensor by $V(-n)$; then we have the induced long exact sequence

$$\dots \rightarrow H^1(X, V(-n) \otimes B_X^1) \rightarrow H^2(X, V(-n)) \rightarrow H^2(X, V^p(-np)) \rightarrow \dots$$

According to Lemma 2.7 there exists a uniform integer n_2 (independent of V) such that for all $n > n_2$ the group $H^1(X, V(-n) \otimes B_X^1)$ vanishes then we have the injection $H^2(X, V(-n)) \hookrightarrow H^2(X, V^p(-np))$ and, iterating,

$$H^2(X, V(-n)) \hookrightarrow H^2(X, V^{(p^t)}(-np^t));$$

but $H^2(X, V^{(p^t)}(-np^t)) = 0$ for $t \gg 0$ (cf. Remark 2.4) then finally $H^2(X, V(-n)) = 0$ for all $n > n_2$ and we are done. \square

3 Theorems

Notation 3.1. Throughout this section k will be, as before, an algebraically closed field of positive characteristic p . Furthermore $W := W(k)$ will denote the ring of Witt vectors over k and R the integral closure of W in the algebraic closure \bar{K} of $K := \text{Frac}(W)$. Till the end of the paper X will denote a connected, smooth and projective scheme over W . Everywhere the subscript R will denote the pull back over $\text{Spec}(R)$.

For any finite extension K' of K we will denote by W' the integral closure of W in K' (with residue field k) and by X' the fibered product $X \times_W W'$. An essentially finite vector bundle over X' has been defined in [12] as a vector bundle V over X' whose restrictions V_k and $V_{K'}$ respectively to $(X')_k := X' \times_{W'} k \simeq X_k$ and $(X')_{K'} := X' \times_{W'} K'$ are essentially finite in the usual sense. Let us fix a W -valued point $x \in X(W)$ and let x_R be the induced R -valued point on X_R . Let \mathcal{L} be the full subcategory of $\text{Coh}(X_R)$ (coherent sheaves over X_R) whose

objects are defined as follows: $V \in \text{Ob}(\text{Coh}(X_R))$ belongs to $\text{Ob}(\mathcal{L})$ if and only if there exists a finite extension K' of K and an essentially finite vector bundle V' over X' , such that V is pull back of V' over X_R . The category \mathcal{L} provided with the fiber functor $x_R^* : \mathcal{L} \rightarrow R\text{-mod}$ is a tannakian lattice as defined by Wedhorn in [15]. We denote by $\pi_1(X_R, x_R)$ the affine R -group scheme associated to it which is the fundamental group scheme of X_R . Now let x' be the section on X' induced by x . A principal bundle E over X' , pointed over x' , is called Nori-reduced if $H^0(E, \mathcal{O}_E) = W'$.

Theorem 3.2. *Let X be a smooth, connected and projective scheme over W of relative dimension $\dim(X/W) \geq 2$. Let H be a relatively very ample line bundle on X . Then there exists an integer d_0 (depending only on X) such that for any $d \geq d_0$, any $Y \in |H^{\otimes d}|$ connected and smooth over W and any section $y \in Y(W)$ the homomorphism $\hat{\varphi} : \pi_1(Y_R, y_R) \rightarrow \pi_1(X_R, y_R)$ induced by the closed immersion $\varphi : Y \hookrightarrow X$ is faithfully flat.*

Proof. As before let K' be any finite extension of K , W' the integral closure of W in K' and X' (resp. Y') the fibered product $X \times_W W'$ (resp. $Y \times_W W'$). It is sufficient to prove that for any Nori-reduced principal bundle $e : E \rightarrow X'$ its restriction to Y' , denoted $e_{Y'} : E_{Y'} \rightarrow Y'$, is still Nori-reduced. So we are assuming that $H^0(E, \mathcal{O}_E) = H^0(X', e_*(\mathcal{O}_E)) = W'$. We tensor by $e_*(\mathcal{O}_E)$ the exact sequence

$$0 \rightarrow \mathcal{O}_{X'}(-d) \rightarrow \mathcal{O}_{X'} \rightarrow \mathcal{O}_{Y'} \rightarrow 0$$

and we consider the long exact sequence associated

$$\dots \rightarrow H^0(X', e_*(\mathcal{O}_E)) \rightarrow H^0(Y', e_{Y'*}(\mathcal{O}_{E_{Y'}})) \rightarrow H^1(X', e_*(\mathcal{O}_E)(-d)) \rightarrow \dots$$

by Lemma 2.3 there exists a uniform d_0 (depending only on X_k) such that $H^1(X_k, e_{k*}(\mathcal{O}_{E_k})(-d)) = 0$ for all $d \geq d_0$ and where E_k denotes the special fiber of E . This implies that $H^1(X', e_*(\mathcal{O}_E)(-d))$ vanishes for all $d \geq d_0$. Thus $E_{Y'} \rightarrow Y'$ is Nori-reduced as $H^0(Y', e_{Y'*}(\mathcal{O}_{E_{Y'}})) = W'$ and this concludes the proof. \square

Theorem 3.3. *Let X be a smooth, connected and projective scheme over W of relative dimension $\dim(X/W) \geq 3$. Let H be a relatively very ample line bundle on X . Then there exists an integer d_1 (depending only on X) such that for any $d \geq d_1$, any $Y \in |H^{\otimes d}|$ connected and smooth over W and any section $y \in Y(W)$ the homomorphism $\hat{\varphi} : \pi_1(Y_R, y_R) \rightarrow \pi_1(X_R, y_R)$ induced by the closed immersion $\varphi : Y \hookrightarrow X$ is an isomorphism.*

Proof. According to Theorem 3.2 we only need to prove that $\hat{\varphi}$ is a closed immersion. This is equivalent to prove that for any finite extension K' of K and any essentially finite vector bundle V over Y' there exists an essentially finite vector bundle U over X' whose restriction $U|_{Y'} = \varphi'^*(U)$ is isomorphic to V (W' , X' and Y' are constructed as in the proof of Theorem 3.2 and

$\varphi' : Y' \hookrightarrow X'$ is the morphism induced by φ). Let us set $X'_n := X' \times_W W/p^{n+1}$ and $Y'_n := Y' \times_W W/p^{n+1}$ for every nonnegative integer n , thus in particular $X'_0 = X'_k$ and $Y'_0 = Y'_k$. Let us denote by V_n the n -th restriction of V to Y'_n and similarly $\varphi'_n : Y'_n \hookrightarrow X'_n$ the n -th restriction of φ' . Now consider the cartesian diagram

$$\begin{array}{ccc} Y'_1 & \hookrightarrow & X'_1 \\ \uparrow & & \uparrow \\ Y'_0 & \hookrightarrow & X'_0. \end{array}$$

By [1] and [10] we know that there exists n_1 (depending only on X'_0) such that for every $d \geq n_1$ and for every $Y'_0 \in |H_k^{\otimes d}|$ the homomorphism

$$\widehat{\varphi}_0 : \pi_1(Y'_0, y'_k) \rightarrow \pi_1(X'_0, y'_k)$$

between the fundamental group schemes of the special fibers of Y' and X' , induced by $\varphi'_0 : Y'_0 \rightarrow X'_0$, is an isomorphism. This implies that there exists an essentially finite vector bundle U_0 over X'_0 such that $\varphi'^*_0(U_0) \simeq V_0$. From the exact sequence

$$0 \rightarrow \mathcal{O}_{X'_0}(-d) \rightarrow \mathcal{O}_{X'_0} \rightarrow \mathcal{O}_{Y'_0} \rightarrow 0$$

we obtain, first tensoring by $\mathcal{E}nd(U_0)$, the long exact sequence

$$H^1(X'_0, \mathcal{E}nd(U_0)(-d)) \longrightarrow H^1(X'_0, \mathcal{E}nd(U_0)) \xrightarrow{\delta_1} H^1(Y'_0, \mathcal{E}nd(V_0)) \longrightarrow$$

$$H^2(X'_0, \mathcal{E}nd(U_0)(-d)) \longrightarrow H^2(X'_0, \mathcal{E}nd(U_0)) \xrightarrow{\delta_2} H^2(Y'_0, \mathcal{E}nd(V_0)) \longrightarrow \dots$$

By Lemmas 2.3 and 2.8 there exists a uniform positive integer d_1 such that $H^1(X'_0, \mathcal{E}nd(U_0)(-d))$ and $H^2(X'_0, \mathcal{E}nd(U_0)(-d))$ vanish for every $d \geq d_1$ thus in particular δ_1 is an isomorphism and δ_2 is injective. This implies that the induced maps:

$$\delta'_1 : H^1(X'_0, \mathcal{E}nd(U_0)) \otimes_k (p/p^2) \rightarrow H^1(Y'_0, \mathcal{E}nd(V_0)) \otimes_k (p/p^2)$$

and

$$\delta'_2 : H^2(X'_0, \mathcal{E}nd(U_0)) \otimes_k (p/p^2) \rightarrow H^2(Y'_0, \mathcal{E}nd(V_0)) \otimes_k (p/p^2)$$

are respectively an isomorphism and an injection. Now $X'_0 \rightarrow X'_1$ is a thickening of order one (cf. [7], (8.1.3)) so the obstruction for the existence of a vector bundle over X'_1 whose restriction over X'_0 is isomorphic to U_0 corresponds to an element $o(U_0)$ of $H^2(X'_0, \mathcal{E}nd(U_0)) \otimes_k (p/p^2)$ (cf. [7], Theorem 8.5.3 or [6], §6, Proposition 3). Then consider $\delta'_2(o(U_0)) = o(V_0) \in H^2(Y'_0, \mathcal{E}nd(V_0)) \otimes_k (p/p^2)$.

This is zero because clearly V_1 extends V_0 , but δ'_2 is injective hence $o(U_0) = 0$ too and U_0 can thus be extended to a vector bundle U'_1 over X'_1 . In general $\varphi_1^*(U'_1)$ is not isomorphic to V_1 , but we know (loc. cit.) that the set of deformations of V_0 over Y'_1 is an affine space under $H^1(Y'_0, \mathcal{E}nd(V_0)) \otimes_k (p/p^2)$. So there exists a unique $t \in H^1(Y'_0, \mathcal{E}nd(V_0)) \otimes_k (p/p^2)$ such that $\varphi_1^*(U'_1) = V_1 + t$, then the vector bundle $U_1 := U'_1 - (\delta'_1)^{-1}(t)$ over X'_1 is such that $\varphi_1^*(U_1) \simeq V_1$ over Y'_1 and of course U_1 is still a deformation of U_0 as $(\delta'_1)^{-1}(t) \in H^1(X'_0, \mathcal{E}nd(U_0)) \otimes_k (p/p^2)$ and the set of deformations of U_0 over X'_1 is an affine space under $H^1(X'_0, \mathcal{E}nd(U_0)) \otimes_k (p/p^2)$. Now consider the cartesian diagram

$$\begin{array}{ccc} Y'_2 & \hookrightarrow & X'_2 \\ \uparrow & & \uparrow \\ Y'_1 & \hookrightarrow & X'_1. \end{array}$$

The obstruction for the existence of a vector bundle U_2 over X'_2 deforming U_1 corresponds to an element $o(U_0)$ of $H^2(X'_0, \mathcal{E}nd(U_0)) \otimes_k (p^2/p^3)$; thus proceeding as in previous step we can find U_2 such that its restriction to Y'_2 is isomorphic to V_2 . It is now clear that for any n we can construct a vector bundle U_n over X'_n extending U_{n-1} over X'_{n-1} whose restriction to Y'_n is isomorphic to V_n . Set $\widetilde{X}' := \varinjlim_{i \in \mathbb{N}} X'_i$ and $\widetilde{U} := \varinjlim_{i \in \mathbb{N}} U_i$. Then \widetilde{U} is a vector bundle over \widetilde{X}' and by [5] §5.1, we finally obtain a vector bundle U over X' whose restriction to Y' is isomorphic to V and whose special fiber is isomorphic to U_0 , by construction. It remains to prove that U is essentially finite and this will be clear once we will prove that its generic fiber $U_{K'}$ is essentially finite over $X'_{K'}$. Since $V_{K'}$ is essentially finite then there exists a principal G -bundle $f : T \rightarrow Y'_{K'}$, for G an étale finite K' -group scheme, such that $f^*(V_{K'}) \simeq \mathcal{O}_T^{\oplus r}$, where $r := rk(U_{K'})$. By Grothendieck-Lefschetz's theorem in characteristic 0 we know that there exists a principal G -bundle $f' : T' \rightarrow X'_{K'}$ over $X'_{K'}$ whose restriction to $Y'_{K'}$ is isomorphic to $f : T \rightarrow Y'_{K'}$:

$$\begin{array}{ccc} T & \hookrightarrow & T' \\ f \downarrow & & \downarrow f' \\ Y'_{K'} & \hookrightarrow & X'_{K'}. \end{array}$$

We want to prove that f' trivializes $U_{K'}$. So let us consider the closed immersion $T \hookrightarrow T'$ and the associated short exact sequence

$$0 \rightarrow \mathcal{O}_{T'}(-d) \rightarrow \mathcal{O}_{T'} \rightarrow \mathcal{O}_T \rightarrow 0$$

that we tensor by $f'^*(U_{K'})$, so that we obtain the following long exact sequence

$$\dots \rightarrow H^0(T', f'^*(U_{K'})) \rightarrow H^0(T, \mathcal{O}_T)^{\oplus r} \rightarrow H^1(T', f'^*(U_{K'})(-d)) \rightarrow \dots$$

If we prove that $H^1(T', f'^*(U_{K'})(-d)) = 0$ then we are done: first of all we observe that U_k has zero Chern classes as V_k has zero Chern classes. This implies that $U_{K'}$ has zero Chern classes too. Moreover $U_{K'}$ is semistable because U_k is. Furthermore $\text{char}(K') = 0$ then in particular $H^1(T', f'^*(U_{K'})(-d)) = 0$ vanishes as desired. □
